CoWriting Kazakh: Learning a New Script with a Robot

Presented by Anara Sandygulova¹

Work by: Anara Sandygulova, Aida Zhanatkyzy¹, Aizada Turarova¹, Bolat Tleubayev¹, Zhanel Zhexenova¹

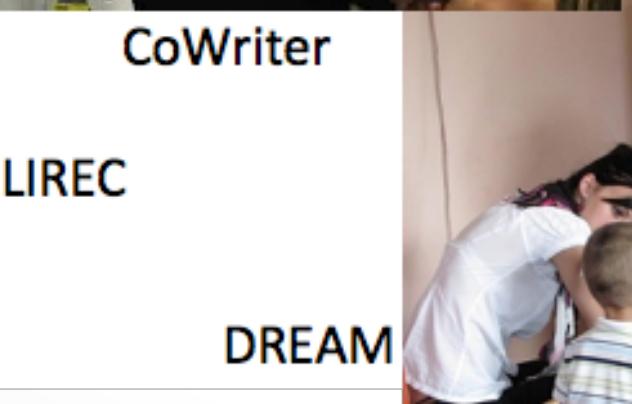

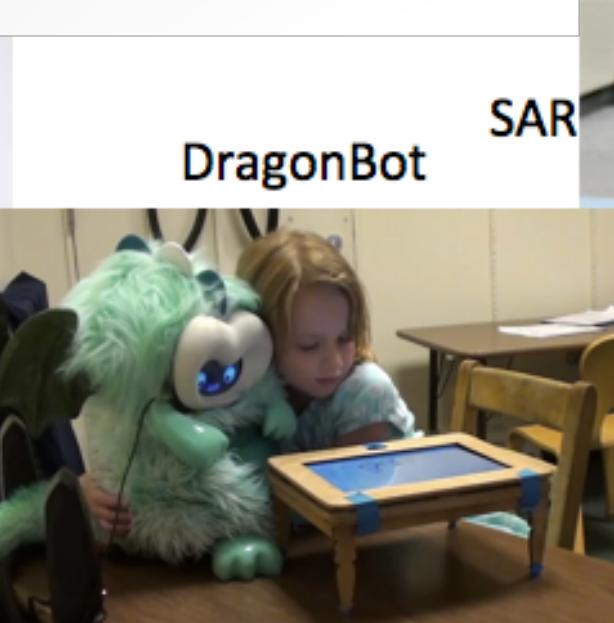

Wafa Johal², Thibault Asselborn², Pierre Dillenbourg²

¹ Nazarbayev University, Kazakhstan

² CHILI lab, EPFL, Switzerland

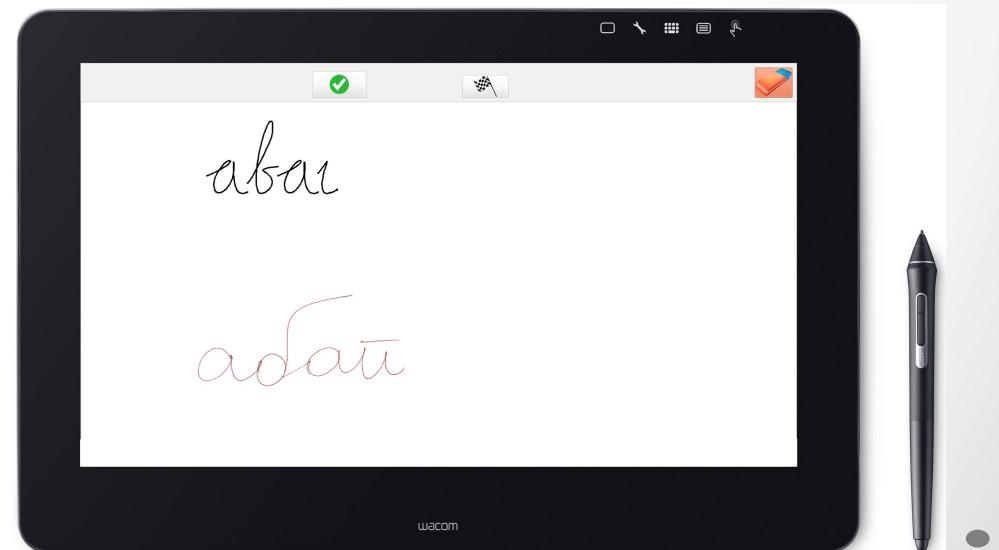

Motivation:

- 
- The map shows the location of Kazakhstan in central Eurasia, with its borders and neighboring countries like Russia, China, and Kyrgyzstan clearly defined. The country is highlighted with a solid green color.
- 1) A recent decision of Kazakhstan's authorities to transition from Cyrillic to Latin alphabet is a risky endeavor and raises many challenges.
 - 2) Considering the need for the current generation of primary school children to be fluent in both scripts, this project aims to assist children via human-robot interaction in learning a new script and its associated handwriting.

CoWriting Kazakh HRI system

- CoWriter project was developed at the CHILI lab in EPFL.
- It aims to help children with the acquisition of handwriting via learning by teaching approach.
- We adapted original CoWriter to Kazakh language and also added OCR for automatic conversion of children's handwriting.

Hypothesis:

It is more effective for learning a new script when a child performs conversion of the word spelling mentally and attempts to write the word in Latin and then observe correctly written Latin spelling by the robot (Latin-to-Latin condition).

Experimental conditions:

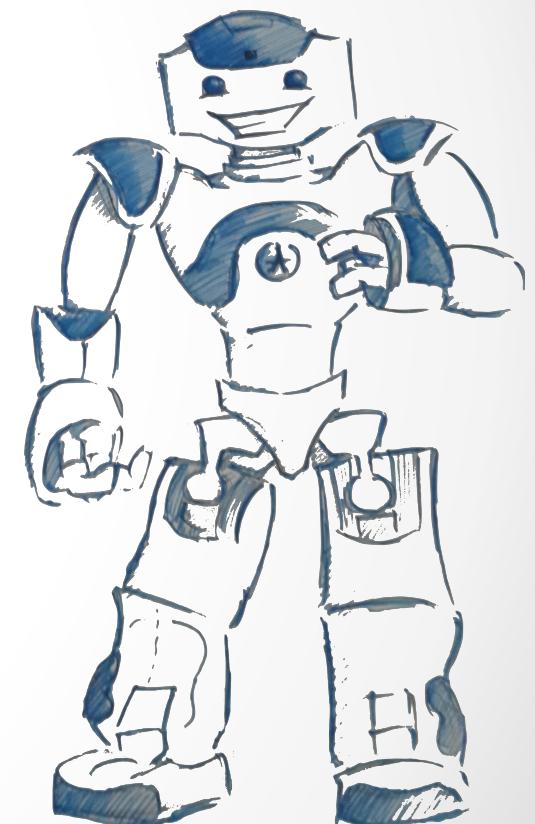

- **Latin-to-Latin demonstration:**

- the child does the conversion mentally and writes directly in Latin

- **Cyrillic-to-Latin demonstration:**

- the robot does the conversion. The child writes in Cyrillic and observes the Latin writing provided by the robot.

SCENARIO

NAO: - Hello. I am a robot. My name is Mimi. [Waves his hand]

Child: - ...

NAO: - I study Kazakh language. Can you help me?

Child: - ...

NAO: - How do you say ``Hello" in Kazakh?

Child: -Salem

NAO: - How do you write it? [In Latin-to-Latin case: Please write it using Latin letters so that I can read it.]

Child: [Writes on a tablet the word in one of the scripts]

NAO: Let me try to write it too [gesticulates]. This is a correct writing using Latin letters.

... repeated for another 12 words for a total of 13 words

NAO: - You are a great teacher. Thank you very much! Goodbye! [waves]

HRI Study

- 67 children aged (32 F) 8-11 years old
- Between-subject design with each child for approximately 15 minutes
- Primary school in the capital of Kazakhstan
- Children did a pre-test and a post-test on their knowledge of Latin alphabet
- Ethical approval by NU IREC committee

Results

- Hypothesis is rejected. No differences between conditions.
- However, a two-way ANOVA demonstrated a significant difference between gender and robot condition: $F (1, 64) = 6.17, p = .016$.
- Males learned more in Cyrillic-to-Latin condition (5.06 ± 3.28 vs 3.59 ± 2.89) while females learned more in Latin-to-Latin condition (3.00 ± 2.87 vs 6.07 ± 5.31).

Discussion

- Exploring strategies of choosing a vocabulary:
 - Foreign language vocabulary: e.g. hello, cat, dog, open, etc.
 - Use of cognates: e.g. robot -> robot, hot dog -> hot dog, but football, computer are written as they are pronounced, thus futbol was mistakenly spelled as footbol.
 - Non-existing/unknown words to avoid confusion with prior knowledge: e.g. nao, uno, etc.
- Child's own choice of the vocabulary to teach the robot

Future Work

- Towards cognitive learning of a new script
- Improvement of handwriting recognition
- Adapting to child's mistakes for personalized learning strategy.

Thank you for your attention!
